Given that you have an object of type datetime.datetime, is there a better way to convert it to a string formatted as YYYY-MM-DD than: date_string = datetime.datetime.strptime(date_obj, '%Y-%m-%d') A: Use dateutils.isoformat(): >>> import dateutils >>> dateutils.format_date('2007-10-19', locale='pt_BR') '2007-10-19' >>> dateutils.format_date('2007-10-19', locale='de_DE') '2007-10-19' >>> dateutils.format_date('2007-10-19', locale='es_ES') '2007-10-19' >>> dateutils.format_date('2007-10-19', locale='fi_FI') '2007-10-19' A: I don't think there is a "Pythonic" way, but this is easy. import datetime import calendar def to_YYYYMMDD(dt): return calendar.monthrange(dt.year,dt.month)[0] + "-" + str(dt.day) A: The pythonic way is to use the builtin datetime module: import datetime my_datetime = datetime.datetime.now() my_date_string = my_datetime.strftime("%Y-%m-%d") The function strftime formats a datetime in a custom way (according to the given template, in this case). 3.
