 | ▢ Veeam One | Cross-Platform Backup | Version 5.2.1 | File Size: 10.5 GB RUNS ON ANY DEVICE Veeam One gives you all the tools you need to protect your data in one manageable package. No special hardware is required, so you can safely protect your on-premises or cloud environment. Connect your Veeam One system to a backup appliance, on-premises or in the cloud, and Veeam One automatically discovers your data and makes it easy to store and access. This unique solution allows you to recover any type of data with ease, whether it's a virtual machine (VM), physical machine (PM), storage volume, or a network device. In this edition, Veeam One has been enhanced to provide users with automatic data deduplication to improve backup and restore speed. The latest release of Veeam Backup & Replication 8.5 has been enhanced to work with VMware's vSphere and Hyper-V hypervisors. In addition, Veeam now supports Deduplication for the Veeam ONE vault. If you have backed up VMs running in a virtual environment, Veeam ONE can deduplicate your backup data. It can create one deduplicated copy of your backup data, which is then stored in a separate location. A read-only copy of the deduplicated data can be accessed from the vault using the new Veeam ONE Dedup Viewer, which is an easy-to-use application that allows you to view, sort, and export the content of your deduplicated backup data. Some of the new features include: • Deduplication for the Veeam ONE vault. • Support for new ESXi features. • Cross-platform single-machine backups. • Improved vCenter Backup and Restore (vCBR) support. • New options to improve backup performance and stability. • New features for Vault support.
