Jackson Libri Tanenbaum Moderni Sistemi Operativi PdfThe present invention concerns a method of manufacturing a printed circuit board with conductive paths and a circuit board manufactured with the method. During manufacture of a circuit board with a conductive path layout, a number of manufacturing operations are required. A conductive path layout is described in EP0 326 003 A2, for example. Such a circuit board is used, for example, in a mobile telephone. For example, connection lines for the antenna and for the keys must be formed on the circuit board. The circuit board must also be inspected for unintentional and correct conductive path layout, and for defective conductive paths, in particular. Finally, the individual conductive paths must be isolated from each other. In the manufacture of circuit boards having a small number of connections (e.g., four connections, eight connections, ten connections, etc.), and therefore small conductive path layouts, a simple method of manufacturing such circuit boards is known from "Siemens-Zeitschrift", Band 45, No. 3/4, 1976, pp. 114-116. In this method, conductive paths are formed by etching in a photolithographic process. Since the width of the conductive paths corresponds approximately to the width of the masks in the photolithographic process, this method has certain disadvantages. One disadvantage of the known method is that, because of the width of the conductive paths, the width of the circuit board is larger than the width of the conductive paths. This method therefore fails for circuit boards with a small number of connections. Another disadvantage of the known method is that the conductive paths in certain areas must be electrically insulated from one another by etching. Circuit boards are also known in which the conductive paths are formed by screening. Screening is described in "Etching and Electroplating" by R. R. Barrer and D. P. Coles, in "Printed Circuits Handbook" by R. C. Edson and C. D. Gee, pages 7.19-7.20, (6th Edition, 1985). This method has the disadvantage that the conductive paths are undesirably irregular and have a certain curvature. Screening is also disadvantageous in that several manufacturing steps must be performed. For a correct connection between the conductive paths and the components to be electrically connected with the

conductive paths, it is also known in the manufacture
